

HARCO LIV compared to CMF PE Ball Valves

Consideration	HARCO LIV	CMF PE Ball Valves
Construction	316 Stainless Steel	All Plastic
Strength	High (not subject to time dependent failures)	Low (subject to time dependent failure mechanisms)
Corrosion/Degradation Resistance	High	High (except when Chlorine disinfectants present such as municipal or reclaimed water)
Turns to Close	17 (will not induce surges, cannot be closed too fast)	$\frac{1}{4}$ or 1 (1/4 turn may induce surges if closed too fast)
Serviceability	Yes (top serviceable)	No (must be cut out if ball & seal malfunction)
Performance in “dirty water” conditions	High	Vulnerable to seizing due to entrained silt and debris
Internal Seals Rubber	EPDM (optimized for water, chemicals, elevated temperature)	Nitrile (optimized for gas)
Pressure Drop/Flow (Cv)	~100	~100 (including effect of upstream elbow and mainline connection)
Actuation	Simple	In case of full turn version a multi-part gear system is present.
